CLASSIFICATION AND TOLERANCES FOR COMMERCIAL STANDARD WEIGHTS THAT
WILL BE ACCEPTED FOR CERTIFICATION BY THE NATIONAL BUREAU OF STANDARDS

Class A. Standards of this class are required to be of a single piece of metal, without adjusting cavity; of non-magnetic material, either practically non-oxidizable or plated with such metals as gold, platinum, rhodium, etc.; and otherwise suitable for such uses as primary standards of the States.

Class B. Standards of this class are required to be of essentially the same construction as those of Class A except that the surface protection may be of such metals as nickel, or of lacquer, and they may have an adjusting cavity closed by a driven plug. They are suitable for such purposes as secondary standards of the States, or as primary standards for local weights and measures officials and weight and scale makers.

Class C. Weights of this class include "test weights" such as are intended primarily for testing scales and weights used in ordinary commercial transactions, and weights used for certain commercial and industrial purposes demanding relatively superior construction and accuracy.

Tolerances

All tolerances for these classes are applicable both to new weights and to weights in service.
